While Photoshop is an excellent program, it's not the only way to get results. You can achieve the same results with other image-editing software, such as Paint Shop Pro, which is included with Photoshop and is often bundled together, or Corel Photo-Paint, a program similar to Photoshop but from Corel. In addition, third-party image-editing software is available as well, including Apple's Aperture and iPhoto software and GIMP. In the following steps, I provide a few tips for getting the best results from Photoshop. 1. Start with a clean, accurate RAW image file. 2. Use the correct color mode. 3. Keep open a file that is always available to avoid losing your work. 4. Edit the image thoroughly, correcting any problems as they crop up. 5. Do your color corrections and any other color-related changes in the layers panel. 6. When you finish a major color change, save the file and change the image back to grayscale. 7. If you need to open the file at a later time, make sure you save it in a different format. Tip: **Use the Layers panel to save and reorder your layers.** You can also resize and crop images when you open them in the Layers panel. To do so, simply drag an image onto the Layers panel and then select the crop tool and drag it to the areas of the image you want to keep. For additional tools and techniques, see Book III, Chapter 1. The following steps help you get started with basic image editing: 1. If necessary, use Photoshop's Print dialog box to ensure that the image meets the print specifications (usually 100 percent scaling and 300 dpi) before you start your editing process. 2. Choose File⇒New to create a new document. 3. If necessary, use the Rectangular Selection tool to select the areas of the image that will be printed. 4. Choose Select⇒Modify⇒Inverse and fill in the resulting outline with the color black. 5. Press Delete to remove the black rectangle and the area that it is outlined. 6. Add an image or adjustment layer, as described in Chapter 4. 7. Position the layer just above the other layers that are relevant to your current project (see Chapter 4).

Photoshop (and Photoshop Elements) is very famous and a very powerful tool. It is the industry standard for professional graphics designers and web developers. Although it can be intimidating at first, it's worth the investment to learn. If you want to make money using Photoshop, you can sell your own images on your own website, use it on commercial sites, edit images for people, or even buy stock photography. Or you could even hire a team of Photoshop experts to do your work for you. In this post, I will share 7 reasons you should learn Photoshop. #1 Photoshop is a Learning Tool Photoshop has evolved tremendously over the last 18 years from a simple bitmap editor to a photo editing tool that can be used to enhance and create amazing images. If you're considering beginning to use Photoshop or have not been using it for a while, you're in luck. Learning Photoshop is an open-ended learning process. You're going to be using it for multiple different things, so you'll learn multiple different things when you learn Photoshop. You will learn the best practices that works for different types of projects. Since you will be editing (or at least learning) multiple different things, it's easy to learn Photoshop if you're trying to learn one thing in particular. For example, if you want to learn making web graphics, you won't need to learn any graphics editing software like GIMP or Photoshop. Why learn Photoshop? Adobe offers free online courses on the basics of Photoshop that are free to watch, with the full tutorial, including making web graphics. Many of the more advanced courses can also be taken for a small fee, and there are many online classes, YouTube tutorials, forums, and other resources to learn Photoshop. #2 Photoshop Will Help You Get Paid More Once you start using Photoshop, you will start using different tools like the Liquify filter. This will become very powerful for you. You can use this tool to create web graphics, mobile app graphics, logos, and many more types of images. As an example, I have a site that has over 6500 social media followers that I use Adobe Illustrator to create logos for. Once I finish the logo, I send it to different designers that can use Photoshop to edit the design to a more professional appearance. I make over $50 per logo, 05a79cecff

Q: python dictionary wordlist not printed as python dictionary I'm having a problem printing a dictionary containing words as key:value pairs. It works perfectly, but is just printing the words as if they were strings and not as I expect. For example the below code prints the word 'py' instead of the key:value pair. please, can anybody tell me the problem here? The dictionary in question is a default dictionary, like so: import collections Python_dictionary = collections.defaultdict(set) word_list = ['bad', 'py', 'you', 'word'] with open('English.txt') as word_file: for line in word_file: words = line.strip().split() for word in word_list: Python_dictionary[word].add(words) Python_dictionary This prints a dictionary with this structure: {'bad': set([],), 'py': set(['you', 'word']), 'you': set(['word']), 'word': set(['bad', 'py', 'you', 'word'])} A: Python_dictionary[word].add(words) word is a string, which is why it prints the string. Try dict[word].update(words). Your defaultdict is not even creating any entries. I think you want: from collections import defaultdict from copy import deepcopy def dict(words): Python_dictionary = defaultdict(set) for words in words: Python_dictionary[words] = deepcopy(set(words)) return Python_dictionary [edit] The earlier version of this answer gave the wrong answer, by the way. In case people read this: do not use defaultdict, it is unmaintained and its behavior is not specified. Using this is a very bad idea. var fs = require('fs'); var common = require('./common');

Q: Video Codec Safe Across Windows and Mac I'm looking at the FFMpeg and X264 libraries, specifically the FFMpeg library for the compression and the X264 library for the encoding. My question is which one is most safe and reliable. I need to compress a video recorded with the webcam onto the PC and transfer it over wifi to a mobile iOS app. I was wondering which codec would be the most reliable to be able to transfer across both operating systems. I'm not looking for a specific answer, I'm just curious if this is an okay choice. A: The situation is unfortunately complex. There is a list of video codecs here, which is maintained by the Fraunhofer. There are many aspects here: All systems work differently when it comes to the codecs themselves. Windows uses those codecs and so does iOS - but macOS tries to use a different set of codecs, and so do some Windows programs. If you do not make it MPEG then some of the properties of the codec may change. The Fraunhofer list offers no compatibility guarantees at all. A different list of properties is offered by the page Video Compression Guidelines. All the video codecs currently have license terms prohibiting copying. Unfortunately this means that any software that you use has to check for license enforcement before it does any work, and also use a different copy of the codec if it detects an enforcement notice. This can be annoying and make it hard to debug, but it is unavoidable. If you use a codec with a license that forbids license enforcement, then you don't have any of the annoying issues about enforcement notice, but you lose the ability to detect modifications to the codec. This means it will be much harder for your software to maintain compatibility with changes to the codec. You can't even detect changes to the codec as an "update", because any software that used it already lost the compatibility. Mac systems will also have a bitrate limit, because Macs are (sometimes) not as powerful as PCs. Mac users usually have a larger range of video hardware, including such devices as game consoles. This makes it easier for them to use some codecs that are not available on PCs. All of this is very complicated. The result is that there are no codecs that are safe and cross-platform. Windows and Mac always have to use the same ones,
